ENTERPRISE SYSTEMS COMPLIANCE DATA-SHEET
INSPECTION TEST REPORT (ITR)

Document Ref: ITR-SYS-INF-2026-001
Date: August 10, 2026
Project Title: Secure Corporate Network & Systems Infrastructure Implementation
Prepared By: Norah Alomayri
Target Role: IT Infrastructure Support Specialist / IT Engineer
Classification: INTERNAL COMPLIANCE REPORT

CONTENTS

1. PROJECT SUMMARY & SCOPE .....…….... [Page 4]
    1.1 Regulatory Compliance & Audit Context
    1.2 System Environment & Deployment Fencing

2. SYSTEM HARDWARE & VIRTUAL PLATFORM LOGS .....……. [Page 4]
    2.1 Hypervisor Configuration Specs
    2.2 Subnet Architecture Mapping

3. NETWORK SERVICES & IP ALLOCATION SCHEMA .....…..... [Page 4]
    3.1 Static Core Infrastructure Settings
    3.2 Dynamic DHCP Scope & Pool Boundaries

4. INDIVIDUAL INSPECTION TEST CASES (ITR LOGS) .....…..... [Page 5]
    4.1 Test Case #1: Centralized Network Lease & DNS Name Resolution
    4.2 Test Case #2: Endpoint Security Hardening (GPO Compliance)
    4.3 Test Case #3: Data Isolation Governance (NTFS Least Privilege)

5. SYSTEM CHANGE CONTROL & RISK PROFILE EVALUATION ... [Page 9]
    5.1 ITIL Change Management Protocols
    5.2 Service Collision Mitigation

6. SIGN-OFF & FIELD INTEGRITY CERTIFICATION .....….... [Page 10]

1. PROJECT SUMMARY & SCOPE

This official technical report documents the validation and deployment logs of a highly secure, virtualized enterprise IT infrastructure environment. The scope of the project is confined to server role optimization, centralized host identity management, strict administrative policy hardening via Group Policy Objects (GPOs), centralized network printing infrastructure, and logical data partition isolation. All validation cases were executed inside an isolated Type-2 hypervisor environment to match enterprise-level deployment expectations.

2. SYSTEM HARDWARE & VIRTUAL ENVIRONMENT LOGS

* **Host Deployment Architecture:** Type-2 Hypervisor (Isolated NAT Network Switch)
* **Subnet Matrix Designation:** 192.168.10.0/24 (Zero Broadcast Spillover)
* **Central Domain Engine Node:** Windows Server 2022 Standard Edition (GUI Interface)
* **Active Workstation Node:** Windows 10 Enterprise (Validated Domain Client)

3. NETWORK SERVICES & IP ALLOCATION SCHEMA

Hostname	Configured Roles	Assignment	IPv4 Address	Subnet
DC-01	AD DS, DNS Server, DHCP	Static	192.168.10.10	/24
Client-01	Engineering Workstation	Dynamic	192.168.10.50	/24
Client-02	HR Department Workstation	Dynamic	192.168.10.51	/24

Note: Client nodes receive automated network assignments via an active DHCP scope pool ranging from 192.168.10.50 to 192.168.10.200. Preferred DNS points strictly to 192.168.10.10 for internal corporate directory resolution.

4. INDIVIDUAL INSPECTION TEST CASES (ITR LOGS)

[TEST CASE #1: CENTRALIZED NETWORK LEASE & DNS NAME RESOLUTION]

- Test Objective:

Validate automated dynamic IP address provisioning and internal domain lookup capabilities across client workstations.

- Test Procedure:

1. Boot validated client workstation (Client-01).
2. Trigger administrative command prompt interface (CMD).
3. Invoke testing strings: 'ipconfig /all' and 'nslookup ap-infrastructure.local'.

- Expected Result:

Workstation must lease an address within the designated pool and resolve the host name of the Domain Controller.

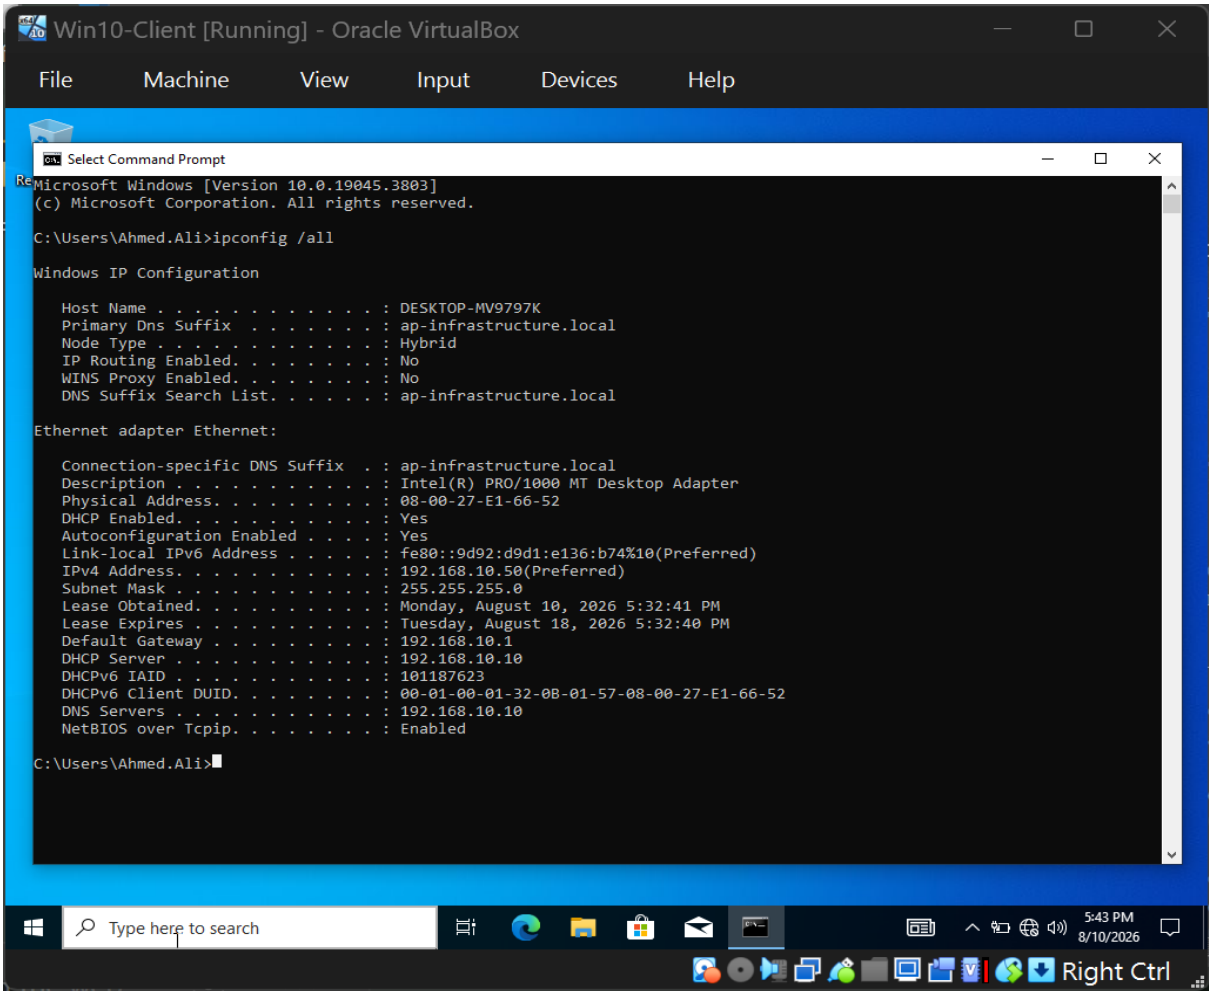

- Actual Result:

Client-01 dynamically leased IP '192.168.10.50'. DNS lookup resolved root forest target '192.168.10.10' with 0ms latency.

- Pass/Fail Status:

PASSED ✓

- Field Evidence:

[TEST CASE #2: USER ENVIRONMENT HARDENING & SECURITY COMPLIANCE]

- Test Objective:

Enforce endpoint data safety regulations to prevent unauthorized external device mounting and systemic environment mutations.

- Test Procedure:

1. Login to Client-01 using standard domain credentials.
2. Execute 'Run' utility (Win+R) and submit command string 'control'.
3. Attempt to mount an unapproved mass-storage virtual media block (USB).

- Expected Result:

Active GPO 'Secure_Workstation_Policy' must block host configuration and device access execution layers.

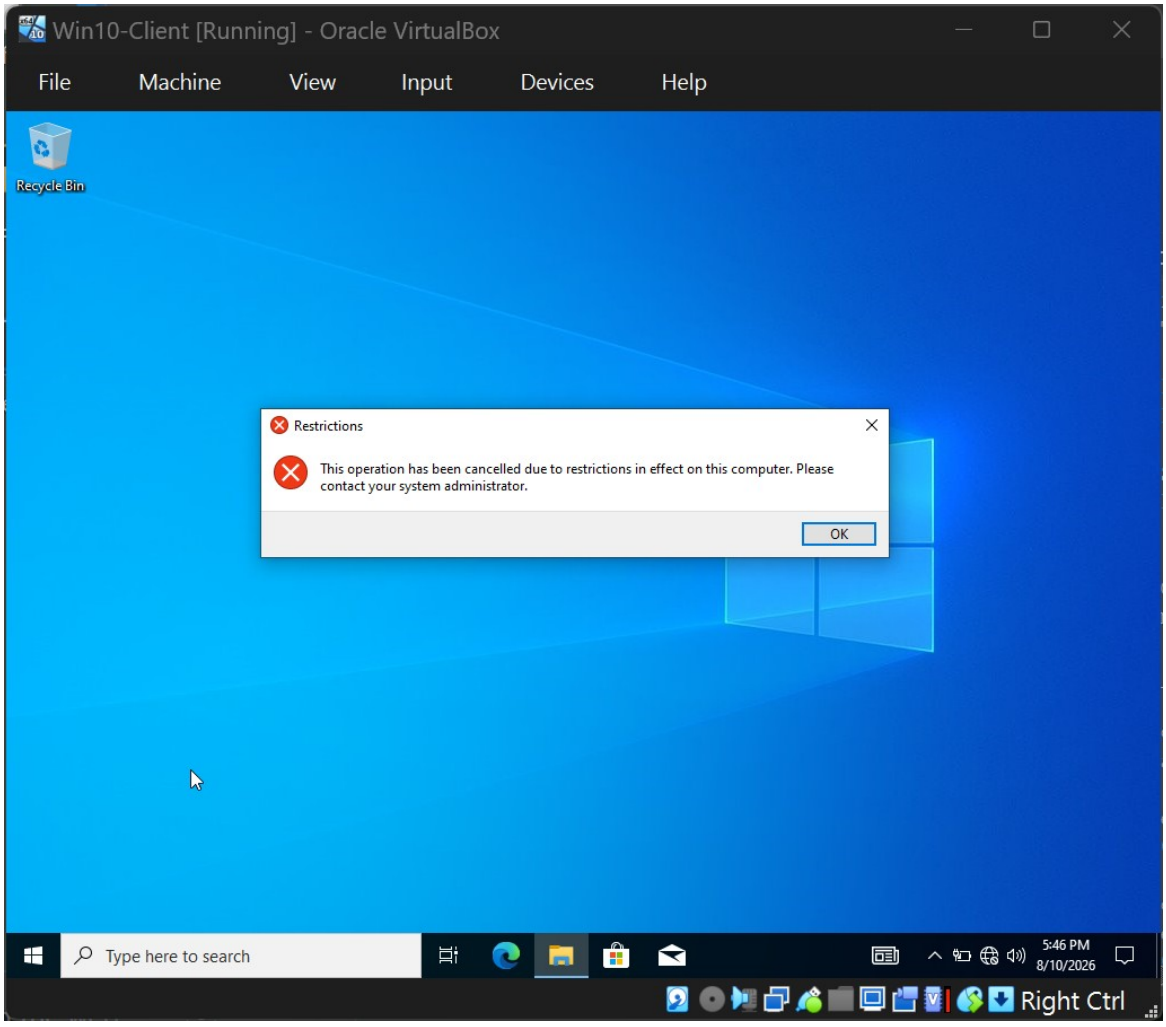

- Actual Result:

Operating system rejected execution, throwing native restriction alert: "This operation has been cancelled due to restrictions in effect...". USB interface reads were successfully dropped.

- Pass/Fail Status:

PASSED ✓

- Field Evidence:

[TEST CASE #3: DATA ISOLATION GOVERNANCE & NTFS LEAST PRIVILEGE ACCESSIBILITY]

- Test Objective:

Validate cross-departmental storage block isolation based on the Principle of Least Privilege (PoLP).

- Test Procedure:

1. Authenticate host login as user 'Ahmed.Ali' (Member of GG_Engineering).
2. Navigate via File Explorer path to shared network folder: '\\192.168.10.10\CompanyShares\'.
3. Confirm read/write/modify access execution inside 'Engineering_Data'.
4. Attempt lateral boundary migration and double-click directory 'HR_Data'.

- Expected Result:

Engineering group members must have active write/modify permissions inside their directory but face hard access rejections when attempting to look into HR assets.

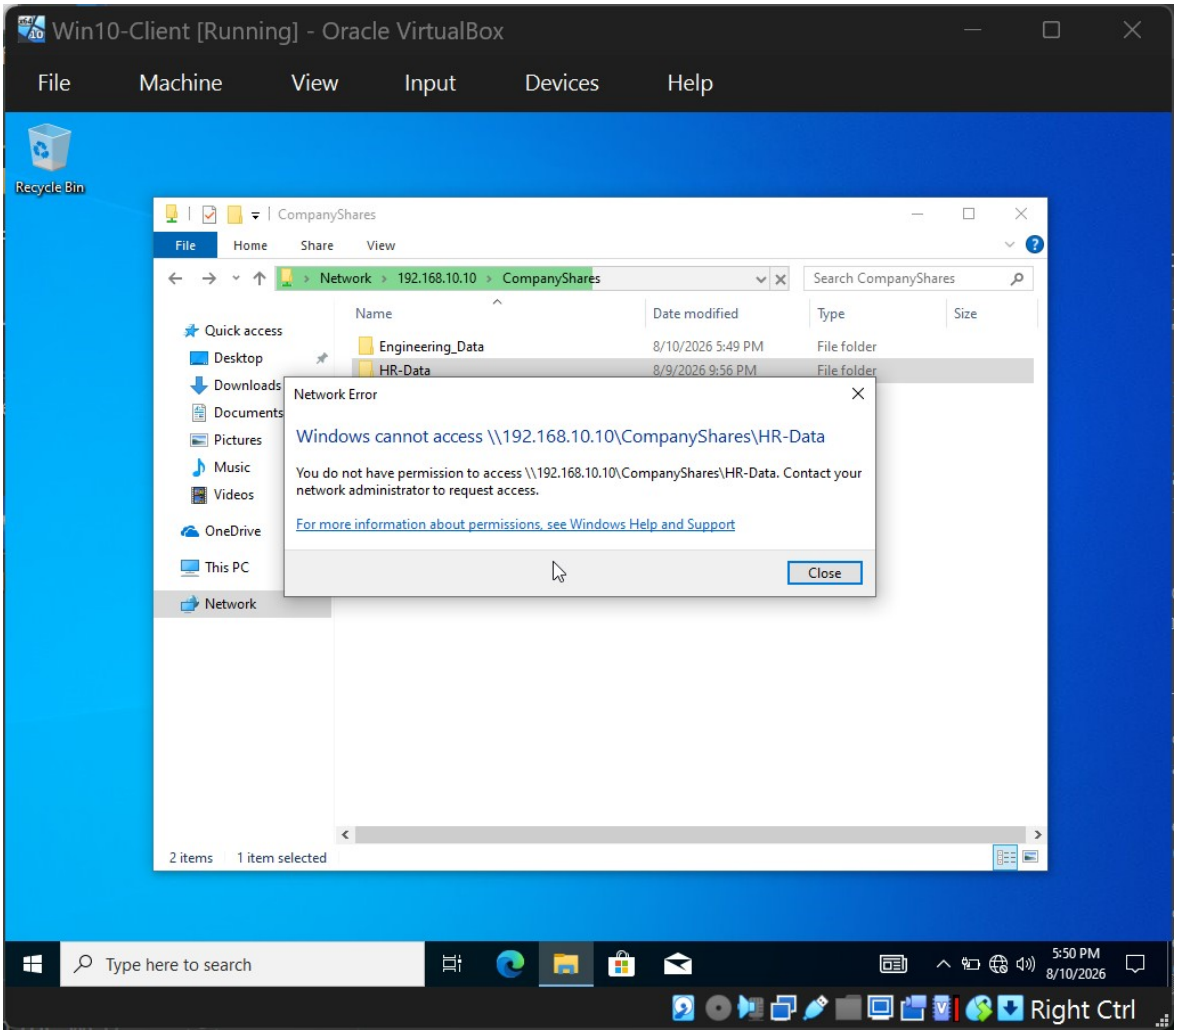

- Actual Result:

File modifications executed successfully inside the engineering directory block. Lateral migration into 'HR_Data' was rejected, throwing system alert: "You don't currently have permission to access this folder."

- Pass/Fail Status:

PASSED ✓

- Field Evidence:

5. SYSTEM CHANGE CONTROL & RISK PROFILE EVALUATION

To protect adjacent network infrastructure operations, all core broadcasting services (DHCP discovery packages and local DNS name resolutions) were completely fenced inside an isolated host-only virtualization switch. Change management processes aligned with ITIL guidelines were maintained throughout the provisioning phase to ensure clean system state tracking, zero service collision, and secure directory hand-over compliance.

6. SIGN-OFF & FIELD INTEGRITY CERTIFICATION

This technical infrastructure architecture satisfies all logical operations, core system configurations, and host safety hardening specifications.

Inspected & Validated By: **Norah Alomayri**
